

Structure of the variable lamellar_child_clusters containing information about martensite lamellae

L. Heller

February 5, 2026

```
child_cluster_idx → dict [20 keys]
    cluster_id → int
    phase_id → int
    phase_name → str: 'M'
    aspect_ratio → float
    length → float
    width → float
    orientation_angle → float
    principal_direction → array[2] <float32>
    perpendicular_direction → array[2] <float32>
    centroid → array[2] <float32>
    end_point_1 → array[2] <float32>
    end_point_2 → array[2] <float32>
    area → float
    n_pixels → int
    eigenvalues → array[2] <float32>
    pca_method → str: 'sklearn'
    is_lamellar → bool
    units → str: 'physical'
    elongation_info → dict [14 keys]
        cluster_id → int
        principal_direction → array[2] <float32>
        perpendicular_direction → array[2] <float32>
        principal_angle → float
        aspect_ratio → float
        length → float
        width → float
        centroid → array[2] <float32>
        eigenvalues → array[2] <float32>
        end_point_1 → array[2] <float32>
        end_point_2 → array[2] <float32>
        area → float
        n_pixels → int
        pca_method → str: 'sklearn'
    length_scale → float
```
